

Combination lock 1168

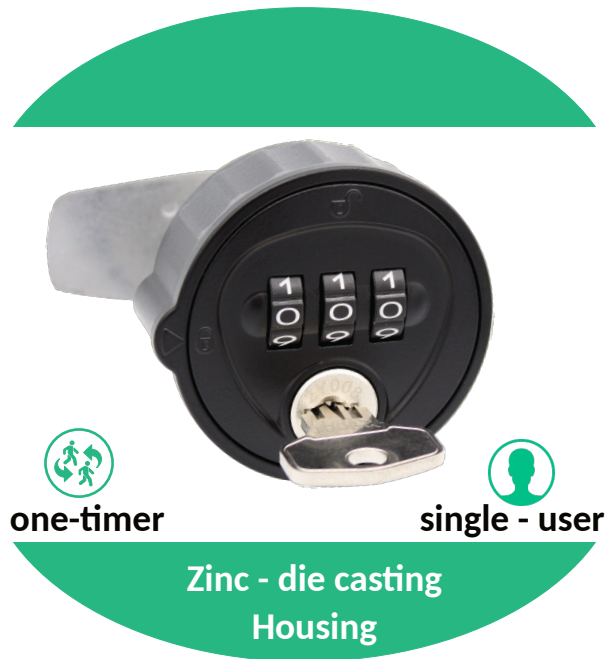

Patented functions according
DE 10 2009 057 188.4

The lock housing of the 1168 fits ergonomically in the hand and forms the complete unlocking and locking mechanism, which makes a knob for opening unnecessary.

The **one - timer** variant allows the lock to be locked once and opened again using its own code, which is stored when the lock is closed. Afterwards, the user must manually wipe the number wheels.

In the **single - user** variant, the 1168 has a coding hole for permanent storage of the personal code.

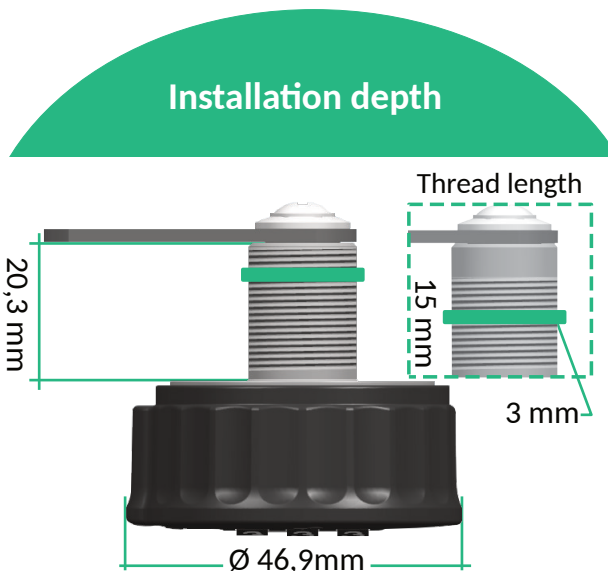

Thanks to the secondary locking cylinder, the lock 1168 allows emergency opening by means of a master key without knowing the set code.

Semi-automatic
Code determination

Product details

- 3-wheel combination with 1,000 possible combinations
- Emergency opening in seconds with master key
- No user administration required
- Different lockings possible
- 2 possible thread lengths
- Unlocking and locking through complete lock housing
